

CARDIAC SURGERY IN PENNSYLVANIA

INFORMATION ABOUT HOSPITALS AND CARDIOTHORACIC SURGEONS

Data: July 1, 2011 to December 31, 2012

Pennsylvania Health Care Cost Containment Council
November 2013

About PHC4

The Pennsylvania Health Care Cost Containment Council (PHC4) is an independent state agency charged with collecting, analyzing and reporting information that can be used to improve the quality and restrain the cost of health care in the state. It was created in the mid-1980s when Pennsylvania businesses and labor unions, in collaboration with other key stakeholders, joined forces to pass market-oriented health care reforms. As a result of their efforts, the General Assembly passed legislation (Act 89 of 1986) creating PHC4.

The primary goal is to empower purchasers of health care benefits, such as employers or labor union health and welfare funds, with information they can use to improve quality and restrain costs. More than 840,000 public reports on patient treatment results are downloaded from the PHC4 website each year. Additionally, nearly 100 organizations and individuals annually acquire data that is tailored to their specific needs through PHC4's special requests process. Today, PHC4 is a recognized national leader in public health care reporting.

It is governed by a 25-member board of directors, representing business, labor, consumers, health care providers, insurers, and state government.

Scan this Quick Response Code with your smartphone (using a QR code reader app) or visit www.phc4.org to learn more about PHC4.

More Data on PHC4's Website

Additional information relevant to this report is posted at www.phc4.org.

- Technical Notes, including information about the methodology and the calculations used for this report.
- Downloadable data, including the numbers associated with the outcome symbols and surgeon results relevant to a particular hospital.
- Total CABG/valve volume figures for hospitals and surgeons.

Hospitals and surgeons are provided an opportunity to submit comments regarding the data. No comments were received for this report.

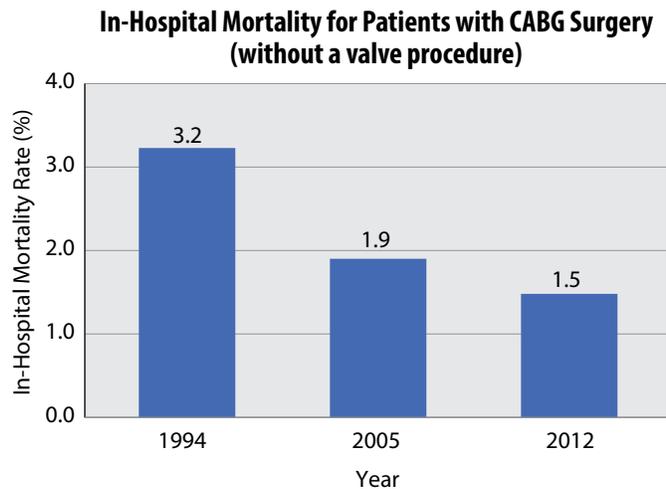

Introduction

This edition of PHC4's *Cardiac Surgery in Pennsylvania* presents outcomes for the 20,164 patients who underwent coronary artery bypass graft (CABG) surgery and/or heart valve surgery between July 1, 2011 and December 31, 2012 in the 59 Pennsylvania general acute care hospitals that performed these types of procedures during that period. The report displays risk-adjusted outcomes that can be used, in part, to evaluate both hospital and surgeon performance. Reported measures include risk-adjusted in-hospital mortality ratings and 30-day readmission ratings. Average hospital charges and average Medicare fee-for-service payments are also reported for hospitals.

Key Findings

Mortality – CABG Surgery (without a valve procedure)

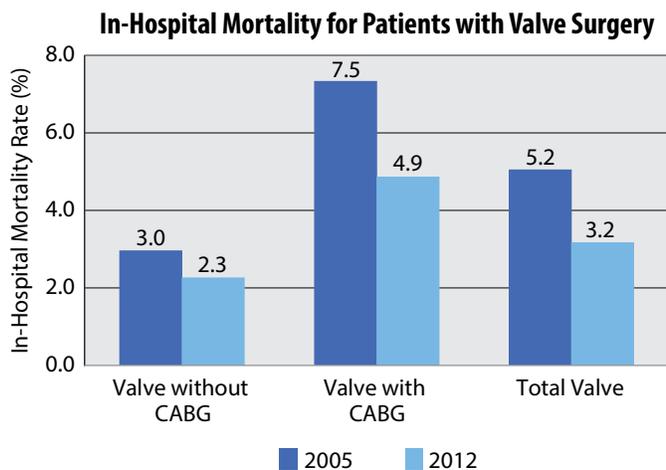

Statewide, in-hospital mortality rates decreased 21% between 2005 and 2012 (from 1.9% to 1.5%*) and 53% between 1994 and 2012 (from 3.2% to 1.5%*) for patients undergoing CABG surgery (without a valve procedure).

Mortality – Valve Surgery

For valve surgery patients, in-hospital mortality rates decreased between 2005, when PHC4 began reporting on valve surgeries, and 2012.

- 23% decrease for the Valve without CABG procedure group (from 3.0% to 2.3%).
- 35% decrease for the Valve with CABG procedure group (from 7.5% to 4.9%*).
- 38% decrease for the Total Valve procedure group (from 5.2% to 3.2%*).

* Difference is statistically significant.

Note: While the outcomes displayed later in this report are based on the 18-month period from July 1, 2011 through December 31, 2012, these Key Findings are based only on data for calendar year 2012 in order to make comparisons to previous calendar years.

Key Findings

Readmissions – 1,462 patients (13.4%) who underwent CABG and/or valve surgery in 2012 were readmitted to the hospital for a heart-related condition or an infection or complication within 30 days of discharge.

Of the four procedure groups reported here, patients who underwent valve with CABG surgery were more likely to be readmitted (17.8%). These patients experienced a higher mortality rate (5.7%) and stayed in the hospital longer (6.9 days) during the readmission.

Readmissions, 2012

Procedure Group	Patients Readmitted within 30 Days		For patients readmitted within 30 days, the readmissions were associated with ...		
	Number	Percent	Mortality Percent	Average Length of Stay	Total Days
Total	1,462	13.4%	2.9%	6.1	8,932
CABG without Valve	751	11.8%	2.9%	5.9	4,413
Valve without CABG	431	14.7%	0.9%	6.0	2,598
Valve with CABG	280	17.8%	5.7%	6.9	1,921
Total Valve	711	15.8%	2.8%	6.4	4,519

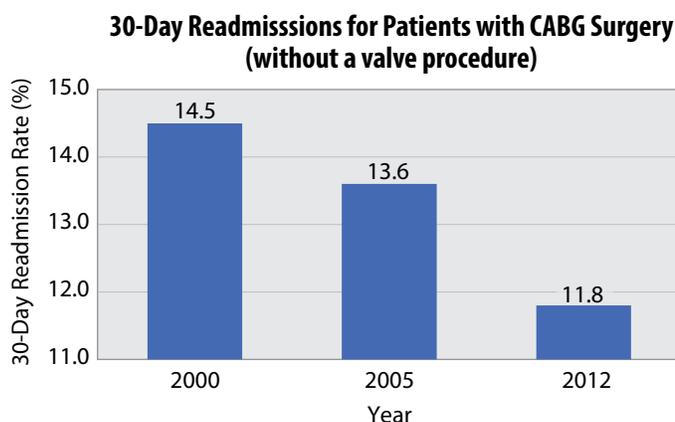

Note: 2012 Readmissions were based on discharges between January 1, 2012 and November 30, 2012. Data from December 2012 was used to identify 30-day readmissions for patients discharged in November.

Note: While the outcomes displayed later in this report are based on the 18-month period from July 1, 2011 through December 31, 2012, these Key Findings are based only on data for calendar year 2012 in order to make comparisons to previous calendar years.

Key Findings

Readmissions – CABG Surgery (without a valve procedure)

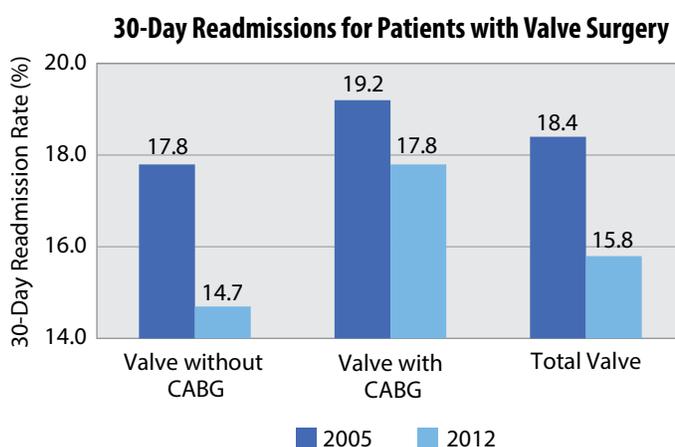

Statewide, 30-day readmission rates decreased 13% between 2005 and 2012 (from 13.6% to 11.8%*) and 19% between 2000 and 2012 (from 14.5% to 11.8%*) for patients undergoing CABG surgery (without a valve procedure).

Readmissions – Valve Surgery

For valve surgery patients, 30-day readmission rates decreased between 2005, when PHC4 began reporting on valve surgeries, and 2012.

- 17% decrease for the Valve without CABG procedure group (from 17.8% to 14.7%*).
- 7% decrease for the Valve with CABG procedure group (from 19.2% to 17.8%).
- 14% decrease for the Total Valve procedure group (from 18.4% to 15.8%*).

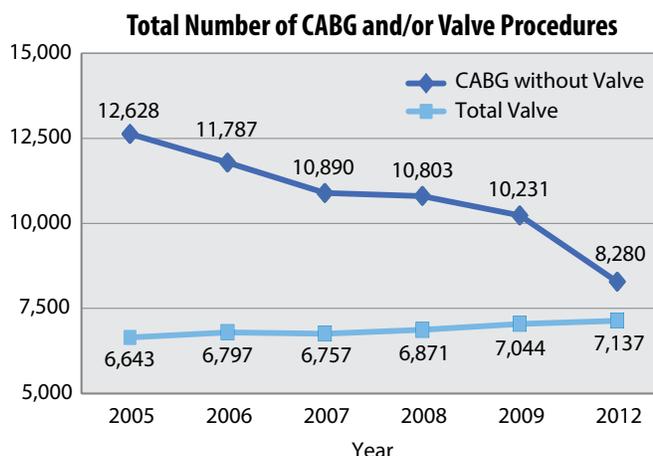

* Difference is statistically significant.

Note: While the outcomes displayed later in this report are based on the 18-month period from July 1, 2011 through December 31, 2012, these Key Findings are based only on data for calendar year 2012 in order to make comparisons to previous calendar years.

Key Findings

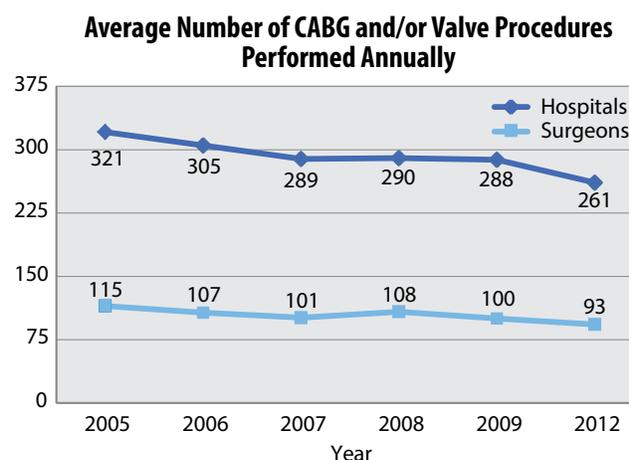

Total Number of CABG and/or Valve Procedures

The total number of CABG without valve procedures declined from 12,628 in 2005 to 8,280 in 2012. The total number of valve procedures (with or without CABG) increased slightly from 6,643 in 2005 to 7,137 in 2012.

Average Number of CABG and/or Valve Procedures

The average number of CABG and/or valve surgeries performed annually by hospitals and by surgeons decreased between 2005 and 2012.

Note: These graphs include total volume counts for the calendar years in which PHC4 published outcome data for CABG and/or valve surgery.

Medicare Fee-for-Service Payment Trends

Average Medicare Fee-for-Service Payment

Procedure Group	2005	2006	2007	2008	2011
CABG without Valve	\$29,175	\$29,697	\$30,448	\$30,546	\$32,564
Valve without CABG	\$42,433	\$41,448	\$43,801	\$47,346	\$47,540
Valve with CABG	\$44,119	\$44,934	\$46,001	\$47,669	\$49,924
Total Valve	\$43,343	\$43,276	\$44,945	\$47,500	\$48,461

Notes: PHC4 did not report Medicare payment data for CABG and/or valve surgery for 2009 or 2010. 2011 Medicare payment data is the most recent available.

Average Medicare payment figures include the Centers for Medicare and Medicaid Services' Medicare Part A hospital insurance fund payment (fee-for-service), but not patient liabilities such as coinsurance and deductibles.

Note: While the outcomes displayed later in this report are based on the 18-month period from July 1, 2011 through December 31, 2012, these Key Findings are based only on data for calendar year 2012 in order to make comparisons to previous calendar years.

Understanding this Report

What is coronary artery bypass graft surgery and what is heart valve surgery?

Coronary artery bypass graft (CABG) surgery is a surgical procedure used to treat patients with blockages in the coronary arteries. During the procedure, a surgeon creates an alternate path for blood to flow to the heart muscle by going around, or bypassing, a blocked section of an artery. CABG is typically recommended for severe blockages that are not treatable by other methods. After the procedure is completed, most patients stay in the hospital for several days and face a prolonged rehabilitation period.

Valve surgery is an open-chest surgical procedure used to replace or repair one or more of a patient's heart valves. Valve surgery is used to treat patients with stenosis (narrowing) and regurgitation (abnormal backflow of blood) of a heart valve. In valve replacement surgery, the diseased valve is removed and replaced with an artificial (mechanical) valve or a biological valve from animal or human tissue. In valve repair surgery, the technique is dependent on the underlying cause of the disease.

Why is it important to look at CABG and valve surgeries?

CABG and valve surgeries are frequently performed, costly surgeries. This report includes hospital and surgeon outcomes for 20,164 patients (age 30 and older) who underwent CABG and/or valve surgery in Pennsylvania general acute care hospitals and were discharged between July 1, 2011 and December 31, 2012.

Although most CABG/valve patients have an excellent prognosis for survival, results following surgery may vary among hospitals and surgeons. There is evidence that information contained in reports such as this encourages hospitals and surgeons to examine their processes and make changes that can improve quality of care and ultimately save lives.

Understanding this Report

About this report

- This report includes hospital-specific and surgeon-specific outcomes for CABG and valve surgeries, as defined by ICD-9-CM (International Classification of Diseases, Ninth Revision, Clinical Modification) codes. Technical Notes relevant to this report provide additional detail. They are posted to PHC4's website at www.phc4.org.
- All of the 59 Pennsylvania general acute care hospitals that performed cardiac surgery during the time period covered in this report are included.
- The hospital names have been shortened in many cases for formatting purposes. Hospital names may be different today than during the time period covered in this report due to mergers and name changes. A list of changes can be found on the PHC4 website at www.phc4.org.

Where does the data come from?

The hospital discharge data used for this report was submitted to PHC4 by the general acute care hospitals that perform CABG/valve surgery. The data submitted to PHC4 by the hospitals was subject to standard validation processes by PHC4. Hospitals and surgeons were asked to verify data accuracy at the individual case level. The ultimate responsibility for data accuracy and completeness lies with each individual hospital. PHC4 wishes to acknowledge and thank the Pennsylvania hospitals and surgeons who participated in the data submission and verification processes used for this report.

The Medicare fee-for-service payment data included in this report was obtained from the Centers for Medicare and Medicaid Services.

Understanding this Report

Accounting for high-risk patients

Some patients who undergo CABG/valve surgery are more seriously ill than others. Included in the data PHC4 receives from Pennsylvania hospitals is information indicating “how sick the patient was on admission” to the hospital. This information is used to account for high-risk patients in order to report fair comparisons among hospitals and surgeons. Using this information, PHC4 developed a complex mathematical formula to “risk adjust” the mortality and readmission data included in this report, meaning that hospitals and surgeons receive “extra credit” for operating on patients who are more seriously ill or at a greater risk than others. Risk adjusting the data is important because sicker patients might be more likely to die or be readmitted.

PHC4 uses the results from laboratory blood tests, supplemental clinical data elements such as percent blockage in a coronary artery, patient characteristics such as age and gender, and billing codes that describe the patient’s medical conditions such as the presence of liver disease, chronic kidney disease, etc. to calculate risk for the patients in this report. A comprehensive description of the risk-adjustment techniques can be found in the Technical Notes on PHC4’s website at www.phc4.org.

PHC4 previously relied on a third-party vendor to collect the clinical data used in risk adjustment. In January 2011, hospitals began submitting the laboratory data directly to PHC4 and in July 2011 began submitting supplemental clinical data. This report is the first cardiac surgery report issued by PHC4 since this transition.

Understanding this Report

What is measured in this report and why are these measures important?

PHC4's mission is to provide the public with information that will help to improve the quality of health care services while also providing opportunities to restrain costs. The measurement of quality in health care is not an exact science. As such, there may be a number of ways to define quality. Outcome measures for this report were chosen because they are important components in examining quality of care for CABG/valve surgery patients.

Results for the measures included in this report are displayed for the following four procedure groups:

- ***CABG without Valve:*** Patients who had at least one CABG procedure (without any valve procedures on the same day).
- ***Valve without CABG:*** Patients who had at least one valve procedure (without any CABG procedures on the same day).
- ***Valve with CABG:*** Patients who had at least one valve procedure and at least one CABG procedure (on the same day).
- ***Total Valve:*** Patients who had at least one valve procedure with or without a CABG procedure (on the same day).

The following measures are reported:

- ***Number of Cases*** – This is the number of surgeries analyzed in this report. This information provides an idea of the experience each facility or surgeon has in treating such patients. Studies have suggested that, in at least some areas, the volume of cases treated by a physician or hospital can be a factor in the success of the treatment. It is important to note, that some CABG/valve patients were not counted in this analysis (for example, those who underwent other complex procedures during the same hospital admission as the CABG/valve surgery and procedures done in Veterans' hospitals and in other states), so the actual number of cases that a hospital or surgeon treated might be higher.

Understanding this Report

- ***Risk-Adjusted In-Hospital Mortality*** – This measure is reported as a statistical rating that represents the number of patients who died during the hospital stay in which the CABG/valve surgery was performed. To determine the mortality rating, PHC4 compares the number of patients one could reasonably expect to die, after accounting for patient risk, with the actual number of deaths. (Please see “Understanding the Symbols” box on this page.) A rating is reported for hospitals and surgeons who performed 30 or more procedures in a particular procedure group.
- ***Risk-Adjusted 30-Day Hospital Readmissions*** – This measure is reported as a statistical rating that represents the number of patients who were readmitted to a Pennsylvania general acute care hospital within 30 days of being discharged from the hospital where the CABG/valve surgery was performed. A readmission was counted only if the patient was readmitted with a principal diagnosis that indicated a heart-related condition or an infection or a complication. Readmissions for other reasons were not included in the analysis. While some re-hospitalizations can be expected, high-quality care may lessen the need for subsequent hospitalizations.

Readmissions were based on discharges between July 1, 2011 and November 30, 2012. Data from December 2012 was used to identify 30-day readmissions for patients discharged in November. To determine the risk-adjusted readmission rating, PHC4 compares the number of patients one could reasonably expect to be readmitted, after accounting for patient risk, with the actual number of readmissions. (Please see “Understanding the Symbols” box on this page.) A rating is reported for hospitals and surgeons who performed 30 or more procedures in a particular procedure group.

Understanding the Symbols

The symbols displayed in this report represent a comparison of an actual rate to what is expected after accounting for patient risk.

	Description	Explanation
○	Rate was significantly lower than expected.	Fewer patients died or were readmitted than could be attributed to patient risk and random variation.
◉	Rate was not significantly different than expected.	The number of patients who died or were readmitted was within the range anticipated based on patient risk and random variation.
●	Rate was significantly higher than expected.	More patients died or were readmitted than could be attributed to patient risk and random variation.

Understanding this Report

- ***Case-Mix Adjusted Average Hospital Charge*** – The amount a hospital bills for a patient’s care is known as the charge. The charge includes the facility fee but does not include professional fees (e.g., physician fees) or other additional post-discharge costs, such as rehabilitation treatment, long-term care and/or home health care. In almost all cases, hospitals do not receive full charges from private insurance carriers or government payers. Hospitals typically receive actual payments that are considerably less than the listed charge. Hospital charges often vary by individual hospital and by regions of the state. The average charge included in this report was adjusted for the mix of cases specific to each hospital and reflects the entire length of stay. An average charge is reported for each hospital with 11 or more cases in a particular procedure group.
- ***Average Medicare Fee-for-Service Payment*** – A separate section of this report displays the average amount a hospital is paid for a Medicare patient in the fee-for-service system (along with the number of cases included in the average payment and the trimmed and case-mix adjusted average hospital charge for these cases). Payments from Medicare Advantage plans (e.g., Medicare HMOs) are not included.

The average Medicare payment was calculated using the dollar amount that the Centers for Medicare and Medicaid Services provided for the Medicare Part A hospital insurance fund payment. Patient liabilities (e.g., coinsurance and deductible dollar amounts) were not included. The average payment was calculated by summing the Medicare payment amounts for the cases in a particular procedure group and dividing the sum by the number of cases in that procedure group. Hospitals were given an opportunity to verify the average Medicare payments reported for their facilities prior to the public release of the information.

Medicare payments are based on formulas that take into account regional variations in the costs of delivering care, the increased costs from teaching doctors still in training, higher costs for hospitals that serve larger numbers of low-income patients, and for costs of new technologies. Medicare payments are based on the entire hospital stay, and the payment principles are common to hospitals nationwide. The most recent Medicare payment data available to PHC4 is for calendar year 2011. The average Medicare payment is reported for each hospital that had 11 or more cases in a particular procedure group.

Understanding this Report

Average charge is also reported for the Medicare cases included in the 2011 average Medicare payment. While the average charge figures were based on the same cases included in the average Medicare payment, the final case-mix adjusted average charge may include fewer cases as a result of exclusions specific to the charge analysis. Average charges are not reported when there are fewer than 11 cases in the average charge analysis for a particular procedure group.

Uses of the report

This report can be used as a tool to examine hospital and surgeon performance for CABG/valve surgery. It is not intended to be a sole source of information in making decisions about CABG/valve surgery, nor should it be used to generalize about the overall quality of care provided by a hospital or a surgeon. Readers of this report should use it in discussions with their physicians who can answer specific questions and concerns about CABG/valve surgery.

- ***Patients/Consumers*** can use this report to aid in making decisions about where and with whom to seek treatment involving CABG/valve surgery. This report should be used in conjunction with a physician or other health care provider when making decisions about CABG/valve surgery.
- ***Group Benefits Purchasers/Insurers*** can use this report as part of a process in determining which hospitals and surgeons provide quality care for employees, subscribers, members or participants who need CABG/valve surgery.
- ***Health Care Providers*** can use this report as an aid in identifying opportunities for quality improvement and cost containment.
- ***Policymakers/Public Officials*** can use this report to enhance their understanding of health care issues, to ask provocative questions, to raise public awareness of important issues and to help constituents identify health care options.
- ***Everyone*** can use this information to raise important questions about why differences exist in the quality and efficiency of care.

Hospital Data

Understanding the Symbols

The symbols displayed in this report represent a comparison of the actual percent of deaths or readmissions the hospital or surgeon had to the percent expected after accounting for how sick the patients were (see page 9).

- Rate significantly lower than expected.
 - ◉ Rate not significantly different than expected.
 - Rate significantly higher than expected.
- NR Not reported. Too few cases.

Number of cases does not include cases excluded for clinical complexity. Total volume figures for all CABG/valve surgeries performed in Pennsylvania hospitals are on PHC4's website: www.phc4.org.

Average hospital charge is for the entire length of stay and was trimmed and case-mix adjusted. In almost all cases, hospitals do not receive full charges from private insurers or government payers; hospitals typically receive actual payments that are considerably less than the listed charge.

Hospital Data

Understanding the Symbols

The symbols displayed in this report represent a comparison of the actual percent of deaths or readmissions the hospital or surgeon had to the percent expected after accounting for how sick the patients were (see page 9).

- Rate significantly lower than expected.
 - ◉ Rate not significantly different than expected.
 - Rate significantly higher than expected.
- NR Not reported. Too few cases.

Number of cases does not include cases excluded for clinical complexity. Total volume figures for all CABG/valve surgeries performed in Pennsylvania hospitals are on PHC4's website: www.phc4.org.

Average hospital charge is for the entire length of stay and was trimmed and case-mix adjusted. In almost all cases, hospitals do not receive full charges from private insurers or government payers; hospitals typically receive actual payments that are considerably less than the listed charge.

The symbols displayed in this report represent a comparison of the actual percent of deaths or readmissions the hospital or surgeon had to the percent expected after accounting for how sick the patients were (see page 9).

- Rate significantly lower than expected.
 - ◉ Rate not significantly different than expected.
 - Rate significantly higher than expected.
- NR Not reported. Too few cases.

For surgeons who operate at more than one hospital, the number of cases and reported outcomes include surgeries performed across all Pennsylvania hospitals.

Number of cases does not include cases excluded for clinical complexity. Total volume figures for all CABG/valve surgeries performed in Pennsylvania hospitals are on PHC4's website: www.phc4.org. Procedures performed in Veterans' hospitals and in other states are not included.

2011 Medicare Fee-for-Service Payment Hospital Data

Average Medicare Payment

The average Medicare payments reported in this section include those made to hospitals for Medicare Fee-for-Service patients meeting the CABG/valve study population criteria who were discharged from a Pennsylvania hospital between January 1, 2011 and December 31, 2011 – the most recent Medicare payment data available. This time period differs from that of the hospital and surgeon outcomes reported on pages 12 through 41 where a different set of data was available. The Medicare payment data was obtained from the Centers for Medicare and Medicaid Services (CMS). Payments from Medicare Advantage plans (e.g., Medicare HMOs) are not included.

Average Hospital Charge

As reported here, the average hospital charge for Medicare Fee-for-Service patients was adjusted for the mix of cases specific to each hospital. Hospitals typically receive actual payments that are considerably less than the listed charge.

NR Not reported. Fewer than 11 cases.

	Cases	Average Medicare Payment	Average Hospital Charge
Statewide			
CABG without Valve	2,359	\$32,564	\$143,647

2011 Medicare Fee-for-Service Payment Hospital Data

Average Medicare Payment

The average Medicare payments reported in this section include those made to hospitals for Medicare Fee-for-Service patients meeting the CABG/valve study population criteria who were discharged from a Pennsylvania hospital between January 1, 2011 and December 31, 2011 – the most recent Medicare payment data available. This time period differs from that of the hospital and surgeon outcomes reported on pages 12 through 41 where a different set of data was available. The Medicare payment data was obtained from the Centers for Medicare and Medicaid Services (CMS). Payments from Medicare Advantage plans (e.g., Medicare HMOs) are not included.

Average Hospital Charge

As reported here, the average hospital charge for Medicare Fee-for-Service patients was adjusted for the mix of cases specific to each hospital. Hospitals typically receive actual payments that are considerably less than the listed charge.

NR Not reported. Fewer than 11 cases.
