

# CARDIAC SURGERY IN PENNSYLVANIA 2007-2008

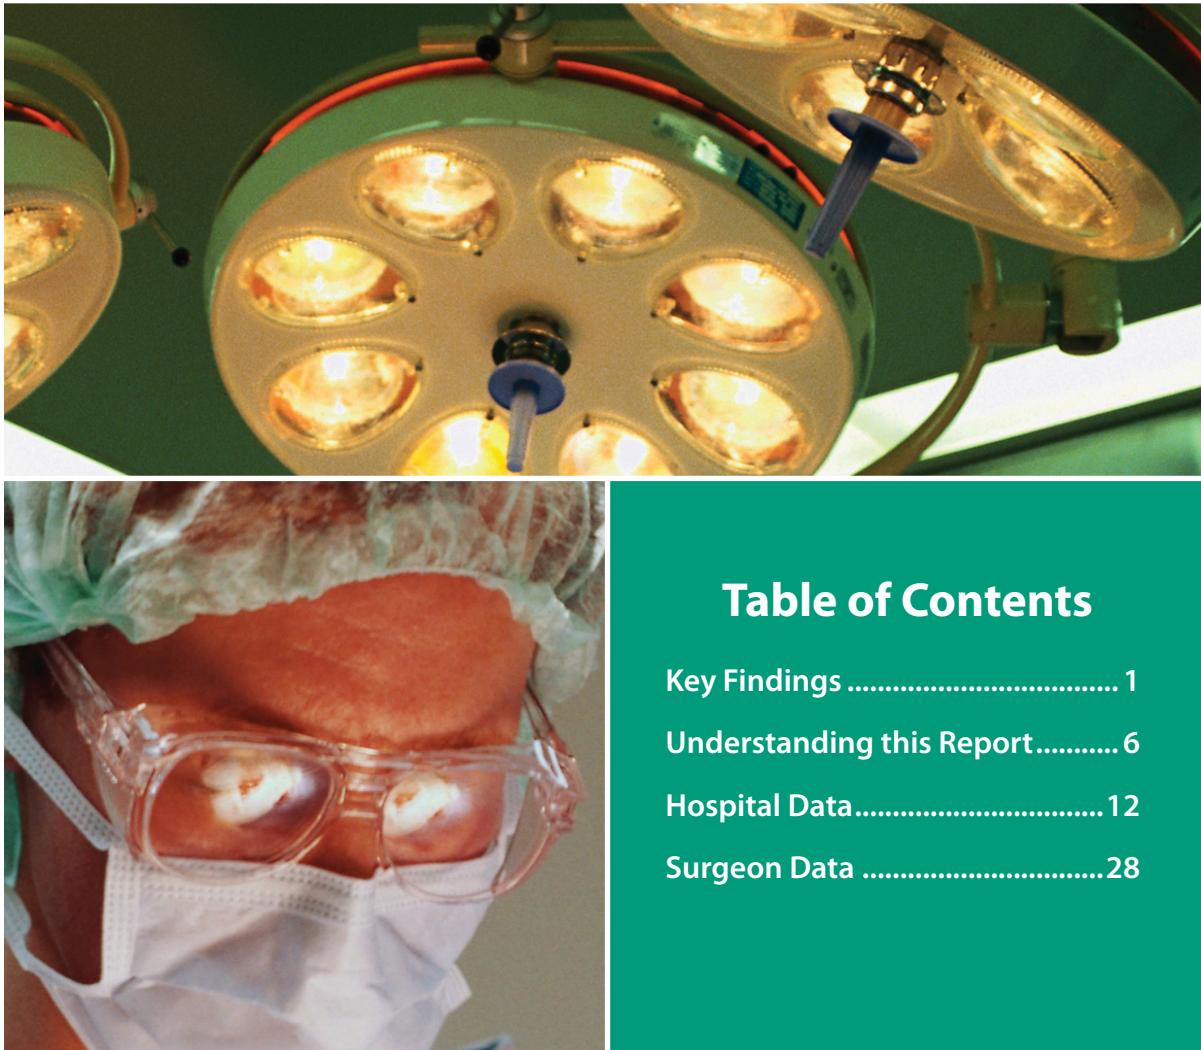

Information about Hospitals and Cardiothoracic Surgeons

Pennsylvania Health Care Cost Containment Council  
September 2010

## About PHC4

The Pennsylvania Health Care Cost Containment Council (PHC4) is an independent state agency established by Pennsylvania law (Act 89 of 1986, as amended). PHC4 is charged with collecting, analyzing and reporting information that can be used to improve the quality and restrain the cost of health care in Pennsylvania.

# Introduction

This edition of PHC4's *Cardiac Surgery in Pennsylvania* presents results of coronary artery bypass graft (CABG) surgeries and/or valve surgeries performed in 60 of the state's general acute care hospitals during 2007 and 2008. This report displays risk-adjusted outcomes that can be used, in part, to evaluate both hospital and surgeon performance. Reported measures include risk-adjusted in-hospital and 30-day mortality ratings, 7-day and 30-day readmission ratings, and post-surgical lengths of stay. Information on average hospital charges and average Medicare payments also are reported for hospitals.

## Key Findings

### Readmissions

- In 2008, 2,208 patients (16.1 percent) who underwent CABG (coronary artery bypass graft) surgery and/or valve surgery were readmitted to the hospital within 30 days of discharge. Only patients readmitted for a heart-related condition or an infection or a complication were counted in the readmission analysis.
- These readmissions amounted to an additional 11,065 hospital days and over \$81 million in additional hospital charges. (*Note: In almost all cases, hospitals do not receive full charges from private insurance carriers or government payers.*)
- Patients who underwent valve *with* CABG surgery had the highest rate of readmission (21.0 percent) when compared to patients who underwent valve *without* CABG surgery (17.8 percent) or CABG *without* valve surgery (14.6 percent).
- Readmitted patients who had undergone valve *with* CABG surgery were more likely to die during the readmission and were more likely to be hospitalized longer when readmitted, as compared to patients who underwent valve *without* CABG surgery or CABG *without* valve surgery.

### Readmissions, 2008

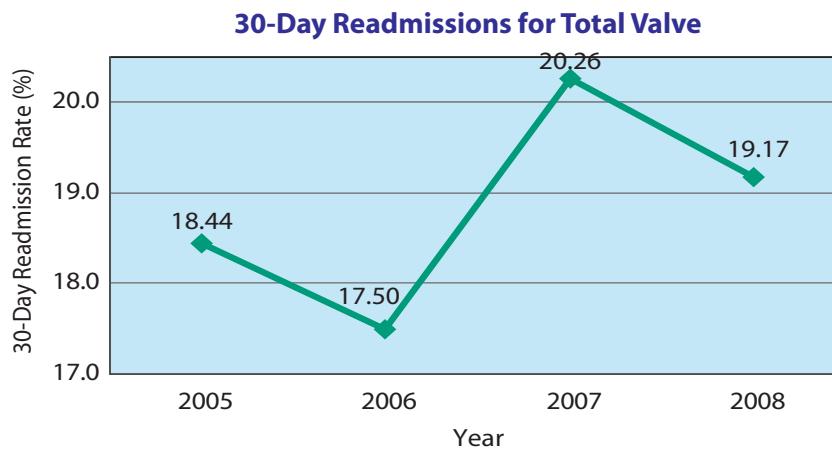

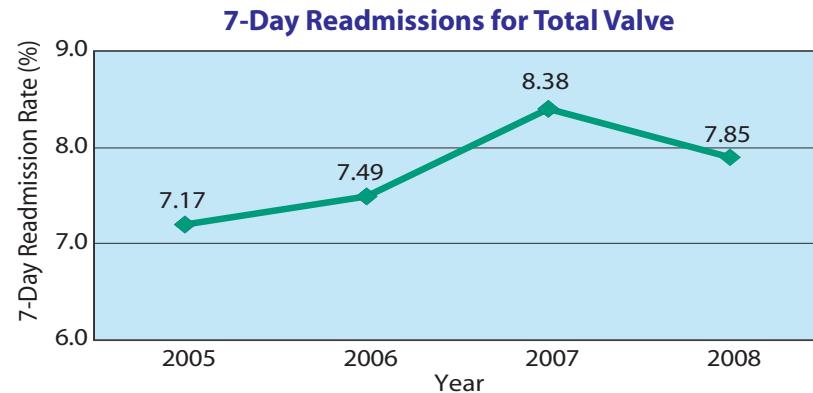

Reporting Group	Patients Readmitted within 30 Days		For patients readmitted within 30 days, the additional hospitalizations were associated with ...				
			Mortality Percent	Average Length of Stay	Total Days	Average Hospital Charge	Total Hospital Charges
Total	2,208	16.1	1.8	5.0	11,065	\$36,777	\$81,203,510
CABG without Valve	1,322	14.6	1.5	4.7	6,176	\$35,330	\$46,706,911
Valve without CABG	468	17.8	1.9	5.2	2,446	\$36,723	\$17,186,413
Valve with CABG	418	21.0	2.4	5.8	2,443	\$41,412	\$17,310,186
Total Valve	886	19.2	2.1	5.5	4,889	\$38,935	\$34,496,599

## Key Findings

### Readmissions – Valve Surgery

For patients undergoing valve surgery, either with or without CABG (total valve reporting group), 7-day and 30-day readmission rates decreased between 2007 and 2008.

- 7-day readmission rates for patients in the total valve reporting group increased between 2005 and 2007 and then decreased 6.3 percent, from 8.38 percent in 2007 to 7.85 percent in 2008.
- 30-day readmission rates for patients in the total valve reporting group decreased 5.4 percent between 2007 and 2008, from 20.26 to 19.17 percent, respectively.

Note: The graphs above include data for each year that PHC4 published readmission rates for valve procedures.

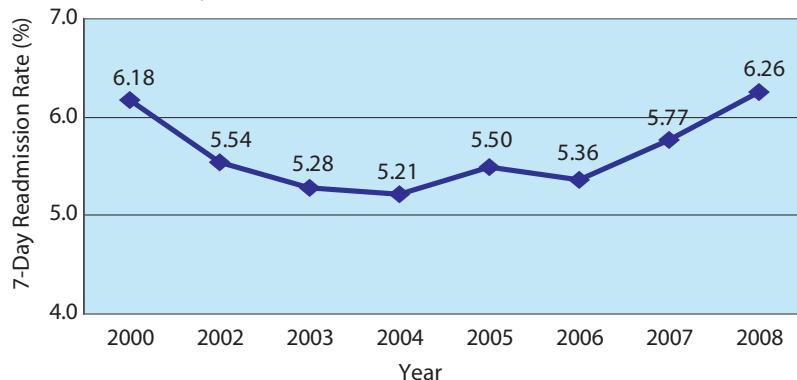

## Key Findings

### Readmissions – CABG Surgery

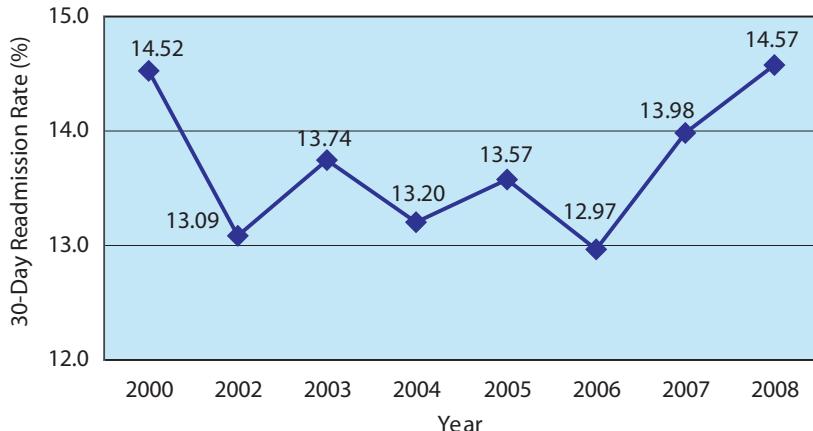

For patients undergoing CABG procedures (without a valve procedure), 7-day and 30-day readmissions increased for the past two years.

- 7-day readmissions steadily declined from 2000 to 2004 for patients undergoing CABG procedures (without a valve procedure). In recent years, the rates have increased. Between 2006 and 2008, 7-day readmissions increased 16.8 percent (from 5.36 to 6.26 percent).
- 30-day readmissions fluctuated between 2000 and 2006 and then increased 12.3 percent between 2006 and 2008 (from 12.97 to 14.57 percent).

**7-Day Readmissions for CABG without Valve**

**30-Day Readmissions for CABG without Valve**

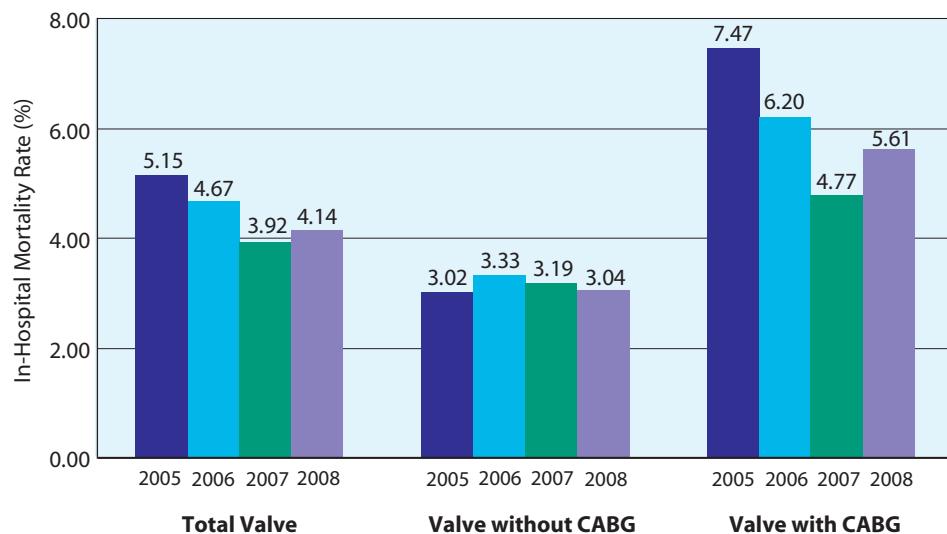

Note: The graphs above include data for each year that PHC4 published readmission rates for CABG procedures.

## Key Findings

### Mortality – Valve Surgery

- In 2008, in-hospital mortality rates for patients undergoing valve surgery, either with or without CABG (total valve reporting group), increased from 3.92 percent in 2007 to 4.14 percent in 2008. This increase followed two years of decreases between 2005 (when PHC4 began reporting on valve surgeries) and 2007.
  - For patients undergoing valve surgery *without* CABG surgery, the trend for in-hospital mortality rates followed a slightly different pattern. In-hospital mortality rates increased between 2005 and 2006 and then decreased more recently. Between 2006 and 2008, in-hospital mortality rates decreased from 3.33 percent in 2006 to 3.04 percent in 2008.
  - For patients undergoing valve surgery *with* CABG surgery, in-hospital mortality rates increased 17.6 percent between 2007 and 2008, from 4.77 to 5.61 percent, respectively. This increase followed two years of decreases in in-hospital mortality rates.

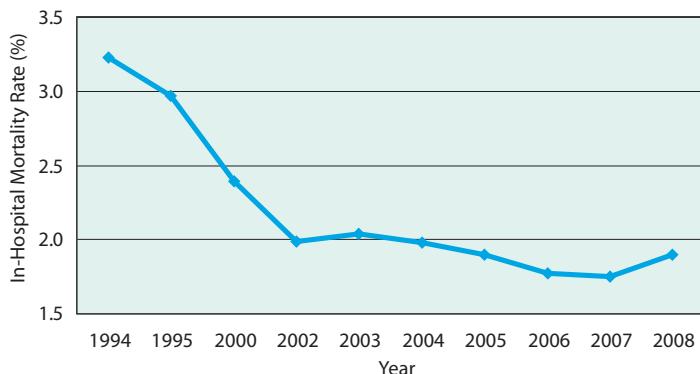

Note: This graph includes data for each year that PHC4 published analysis for valve procedures.

# Key Findings

## Mortality – CABG Surgery

- After declining for more than a decade, in-hospital mortality rates for patients undergoing coronary artery bypass graft (CABG) procedures (without a valve procedure) increased from 1.75 percent in 2007 to 1.90 percent in 2008. Between 1994, when the in-hospital mortality rate was 3.23 percent, and 2007, rates dropped 45.8 percent.

Note: This graph includes data, beginning with 1994, for each year that PHC4 published analysis for CABG procedures.

## Medicare Payments

- The average Medicare payments for patients undergoing CABG and/or valve surgeries for 2005, 2006, and 2007 have been similar across time. However, notable differences can be seen among the amounts paid for patients undergoing CABG surgery (without a valve procedure) and patients undergoing valve surgeries *with or without* CABG.

Average Medicare Payment\*

Reporting Group	2005	2006	2007
CABG without Valve	\$29,175	\$29,697	\$30,448
Valve without CABG	\$42,433	\$41,448	\$43,801
Valve with CABG	\$44,119	\$44,934	\$46,001
Total Valve	\$43,343	\$43,276	\$44,945

\*Includes the CMS Medicare Part A hospital insurance fund payment, but not patient liabilities, such as coinsurance and deductibles.

Note: 2007 Medicare payment data is the most recent available for use in this report.

## Understanding this Report

---

### What is coronary artery bypass graft surgery and what is heart valve surgery?

Coronary artery bypass graft (CABG) surgery is a surgical procedure used to treat patients with blockages in the coronary arteries. During the procedure, a surgeon creates an alternate path for blood to flow to the heart muscle by going around, or bypassing, a blocked section of an artery. CABG is typically recommended for severe blockages that are not treatable by other methods. After the procedure is completed, most patients stay in the hospital for several days and face a prolonged rehabilitation period.

Valve surgery is a surgical procedure used to replace or repair one or more of a patient's heart valves. Valve surgery is used to treat patients with congenital (present at birth) heart disease, degenerative (age-related "wear and tear") disease and conditions such as rheumatic heart disease. In valve replacement surgery, the diseased valve is removed and replaced with an artificial (mechanical) valve or a biological valve harvested from animal or human tissue. In valve repair surgery, the technique is dependent on the underlying cause of the disease.

### Why is it important to look at CABG and valve surgeries?

CABG and valve surgeries are frequently performed and costly surgeries. This report includes information on approximately 31,300 CABG and/or valve surgeries performed in Pennsylvania general acute care hospitals in 2007 and 2008.

Although most CABG/valve patients have an excellent prognosis for survival, results following surgery may vary among hospitals and surgeons. There is evidence that information contained in reports such as this encourages hospitals and surgeons to examine their processes and make changes that can improve quality of care and ultimately save lives.

### What is measured in this report and why are these measures important?

Outcome measures for this report were chosen because they are important components in examining quality of care. Further, they can be reliably measured and compared across hospitals. This report includes information on the number of surgeries performed, in-hospital and 30-day mortality rates, readmission rates within 7 and 30 days, and data on post-surgical lengths of stay for both hospitals.

and surgeons, as well as average hospital charges and average Medicare payments for hospitals only. The reporting groups are divided as follows:

- **CABG without Valve** comprises patients who had at least one CABG procedure without any valve procedures during the same admission.
- **Valve without CABG** comprises patients who had at least one valve procedure without any CABG procedures during the same admission.
- **Valve with CABG** comprises patients who had at least one valve procedure and at least one CABG procedure during the same admission.
- **Total Valve** comprises patients who had at least one valve procedure with or without a CABG procedure during the same admission.

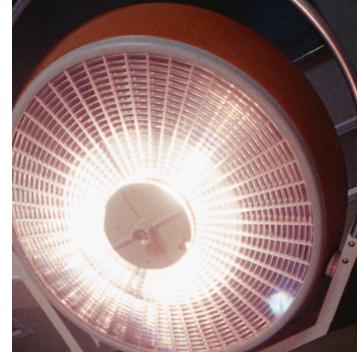

Number of cases is reported for all hospitals and surgeons. Information on CABG/valve results is reported for the hospitals and surgeons who performed 30 or more procedures on adults in at least one of the four reporting groups in 2007 and 2008. Surgeon outcomes are based on two years of combined data, 2007 and 2008. The resulting increase in volume of cases per surgeon results in a more robust analysis. Hospital outcomes are reported for the combined 2007 and 2008 data and for 2008 data only. Average hospital charge and average Medicare payment are re-

ported for hospitals that had at least 13 cases in a particular reporting group.

**Number of cases** – This is the number of surgeries analyzed in this report. The cases are divided into four reporting groups: CABG without valve, valve without CABG, valve with CABG and total valve. It is important to note, however, that some CABG/valve patients were not counted in this analysis (for example, those who underwent other complex procedures during the same hospital admission as the CABG/valve surgery and procedures done in Veterans' hospitals and in other states), so the actual number of cases that a hospital or surgeon treated might be higher.

**In-hospital mortality** – This measure represents the number of patients who died during the hospital stay in which the CABG/valve surgery was performed.

**30-day mortality** – This measure represents the number of patients who either 1) died during the hospitalization in which the CABG/valve surgery was performed, even if it was after 30 days, or 2) died after discharge, but within 30 days of the procedure. The data used for this analysis does not clearly characterize whether a patient's death within 30 days was related to the CABG/valve surgery, so there may be deaths included in the analysis that were unrelated to the surgery. Deaths clearly caused by unusual circumstances, such as those related to motor vehicle accidents or suicides, were excluded.

### **7-day and 30-day hospital readmissions**

These measures examine how often patients were readmitted to a Pennsylvania general acute care hospital within 7 days or 30 days of being discharged from the hospital where the CABG/valve surgery was performed. A readmission was counted only if the patient was readmitted with a principal diagnosis that indicated a heart-related condition, or an infection or a complication that was likely related to the CABG/valve surgery hospitalization. Readmissions for other reasons were not included in the analysis. Readmission rates are important from both a quality of care and cost standpoint.

Information on both 7-day and 30-day readmissions is reported because the reasons for readmission may vary across these time periods. Seven-day readmissions account for those readmissions that are closer in time to the initial hospitalization and may be more directly related to the CABG/valve surgery hospitalization. At the same time, some complications may occur after the first 7 days; therefore, including 30-day readmission rates provides a more complete picture.

**Post-surgical length of stay** – This measure represents how long a patient stayed in the hospital after undergoing CABG/valve surgery and is reported in average days. The average reported is the geometric mean. (Geometric means are the result of the natural log transformation that was done to adjust

for skewness in the distribution. See the Technical Notes for a more detailed explanation of geometric means.) While complications following surgery were not examined for this report, other analysis has shown that complications following CABG/valve surgery add to the length of time a patient stays in the hospital.

**Average hospital charge** – The amount a hospital bills for a patient's care is known as the charge. The charge includes the facility fee but does not include professional fees (e.g., physician fees) or other additional post-discharge costs, such as rehabilitation treatment, long-term care and/or home health care. Where hospital charges are concerned, in almost all cases, hospitals do not receive full charges from private insurance carriers or government payers. In fact, on an average basis, across all inpatient hospital cases statewide, hospitals are reimbursed or paid for approximately 26 percent of established charges.<sup>1</sup> Hospital charges often vary by individual hospital and by regions of the state. The average charge reported is for the entire length of stay. A hospital's cost for the stay is an amount that is different from the charge and the payment.

**Average Medicare payment** – This is the average amount a hospital is paid for a Medicare patient in the fee-for-service system. Payments from Medicare Advantage plans (Medicare HMOs) are not included. Again, the amount paid will be different from the charge.

<sup>1</sup> The statewide revenue-to-charge ratio is derived from the annual net inpatient revenue and inpatient charges provided by each hospital as part of their annual financial filings to PHC4. This figure is for Fiscal Year 2008.

The average Medicare payment was calculated using the dollar amount that the Centers for Medicare and Medicaid Services (CMS) provided for the Medicare Part A hospital insurance fund payment. Patient liabilities (e.g., coinsurance and deductible dollar amounts) were not included. The average payment was calculated by summing the Medicare payment amounts for the cases in a particular reporting group and dividing the sum by the number of cases in that reporting group. Hospitals were given an opportunity to verify the average Medicare payments reported for their facilities prior to the public release of the information.

Medicare payments are based on formulas that take into account regional variations in the costs of delivering care, the increased costs from teaching doctors still in training, higher costs for hospitals that serve larger numbers of low-income patients, and for costs of new technologies. PHC4 is reporting average Medicare payments for 2007 cardiac cases only because 2007 payment data is the most recent available for use in this report.

Medicare payments are based on the entire hospital stay, and the payment principles are common to all hospitals nationwide. Commercial payers, on the other hand, typically negotiate one-by-one with each hospital, and commercial payments can vary by health plan

type (e.g., HMO, PPO, etc.). Commercial contracts may vary in the basis for payment, such as a payment for each day rather than for the entire stay, payments that include hospital and physician fees together, or a lump sum payment for a number of patients. So, PHC4 is working through its Payment Data Advisory Group to develop an appropriate and consistent reporting process.

## Uses of the report

This report can be used as a tool to examine hospital and surgeon performance for CABG/valve surgery. It is not intended to be a sole source of information in making decisions about CABG/valve surgery, nor should it be used to generalize about the overall quality of care provided by a hospital or a surgeon. Readers of this report should use it in discussions with their physicians who can answer specific questions and concerns about CABG/valve surgery.

- Patients/consumers can use this report to aid in making decisions about where and with whom to seek treatment involving CABG/valve surgery. This report should be used in conjunction with a physician or other health care provider when making decisions about CABG/valve surgery.
- Group benefits purchasers/insurers can use this report as part of a process in determining which hospitals and surgeons provide quality care for employees,

subscribers, members, or participants who need CABG/valve surgery.

- Health care providers can use this report as an aid in identifying opportunities for quality improvement and cost containment.
- Policymakers/public officials can use this report to enhance their understanding of health care issues, to raise public awareness of important issues and to help constituents identify health care options.
- Everyone can use this information to raise important questions about why differences exist in the quality and efficiency of care.

### **Where does the data come from?**

Most of the data used for this report was submitted to PHC4 by general acute care hospitals that perform CABG/valve surgery. It encompasses inpatient hospital discharges from January 1, 2007 to December 31, 2008 in which the patient underwent CABG/valve surgery. The data submitted to PHC4 by the hospitals was subject to verification for accuracy by the hospitals, surgeons and PHC4. The ultimate responsibility for data accuracy and completeness lies with each individual hospital.

Some data elements used in the report were obtained from additional sources. The Pennsylvania Department of Health provided data used to analyze the 30-day mortality measure. The Centers for Medicare and Medicaid Services provided Medicare payment data.

### **Accounting for high-risk patients**

Some patients who undergo CABG/valve surgery are more seriously ill than others. Hospitals provided data on “how sick the patient was on admission.” This information is used to make sure that differences in the illness level of patients are accounted for when reporting information on CABG/valve surgery.

In order to report fair comparisons among hospitals and surgeons, PHC4 developed a complex mathematical formula to “risk adjust” the data, meaning that hospitals and surgeons receive “extra credit” for operating on patients that are more seriously ill or at a greater risk than others. Risk adjusting the data is important because sicker patients might be more likely to die following CABG/valve surgery, stay in the hospital longer, or be readmitted. A comprehensive description of how these adjustments are made can be found in the Technical Notes document that accompanies this report. It can be found on PHC4’s website at [www.phc4.org](http://www.phc4.org).

### **What do the symbols mean?**

The symbols in this report represent the results of how well hospitals and surgeons performed surgery and cared for the patient. A statistical test is done to determine whether differences in the results are simply due to chance or random variation. A difference is called “statistically significant” when there is 95 percent confidence that the difference is not likely to

result from chance or random variation. Using in-hospital mortality as an example:

- lower than expected (meaning that the hospital or surgeon had fewer deaths than expected after accounting for how sick the patients were)
- same as expected (meaning that the hospital or surgeon had as many deaths as expected after accounting for how sick the patients were)
- higher than expected (meaning that the hospital or surgeon had more deaths than expected after accounting for how sick the patients were)

## Acknowledgements

PHC4 wishes to acknowledge and thank the Pennsylvania hospitals and surgeons who participated in the data submission and verification processes used for this report.

PHC4 thanks the Centers for Medicare and Medicaid Services for the Medicare payment data. PHC4 also thanks the Bureau of Health Statistics and Research, Pennsylvania Department of Health, Harrisburg, Pennsylvania, for providing information used in the 30-day mortality measure. The Pennsylvania Department of Health specifically disclaims responsibility for any analyses, interpretations or conclusions.

## TABLE NOTES

**For Hospital and Surgeon Data** - 30-day mortality includes in-hospital mortality. The mortality, readmission, and length of stay figures account for varying illness levels among patients. Length of stay is the average number of days spent in the hospital following CABG/valve surgery.

**For Hospital Data Only** - Average hospital charge and average payment are for the entire length of stay. Average charge was trimmed and case-mix adjusted. Note that in almost all cases, hospitals do not receive full charges from private insurance carriers or government payers; on an average basis, across all inpatient hospital cases statewide, hospitals are reimbursed or paid for approximately 26 percent of established charges. Average Medicare payment was not trimmed or adjusted. Average Medicare payment for hospitals with less than 13 cases was suppressed to meet current Centers for Medicare and Medicaid Services privacy guidelines. Hospitals had an opportunity to verify the average Medicare payments reported for their facility prior to the public release of the information.

**For Surgeon Data Only** - The actual number of CABG/valve surgeries performed may be under-reported (e.g., cases excluded for clinical complexity and procedures done in Veterans' hospitals and in other states are not included in this analysis). Total figures on all open heart surgeries (including CABG/valve) performed in Pennsylvania hospitals are available on PHC4's website.
