About the Report

What is the purpose of this report?

The Pennsylvania Health Care Cost Containment Council's (PHC4) *Hospital Performance Report* (HPR) displays volume and outcome information about a variety of medical conditions for Pennsylvania general acute care hospitals. The HPR can assist consumers and purchasers in making more informed health care decisions. The report can also serve as an aid to providers in highlighting additional opportunities for quality improvement and cost containment. It should not be used in emergency situations.

About this report

- This report includes hospital-specific outcomes for 17 different medical conditions, as defined by ICD-10-CM (International Classification of Diseases, Tenth Revision, Clinical Modification) codes and MS-DRGs (Medicare Severity – Diagnosis-Related Groups). Technical Notes relevant to this report provide additional detail. They are posted to PHC4's website at phc4.org.
- This report covers adult (18 years and older) inpatient hospital discharges, regardless of payer, during the period October 2021 through September 2022.
- Cases with a diagnosis of COVID-19 were not included in this report.
- All Pennsylvania general acute care and several specialty general acute care hospitals are included. Children's hospitals and some specialty hospitals are not reported because they typically treat few cases relevant to the conditions included in this report. Hospitals that closed or merged with other facilities are not reported, nor are hospitals that recently opened since the data available does not represent the full time frame of the report.
- Hospital names have been shortened in many cases for formatting purposes. Hospital names may be different today than they were during the period covered in this report due to mergers and name changes.

About the data

Hospital discharge data compiled for this report was submitted to PHC4 by Pennsylvania hospitals. The data was subject to standard validation processes by PHC4 and verified for accuracy by the hospitals at the individual case level. The ultimate responsibility for data accuracy and completeness lies with each individual hospital.

Medicare fee-for-service payment data was obtained from the Centers for Medicare and Medicaid Services (CMS).

About the Report

Accounting for high-risk patients

Included in the data PHC4 receives from Pennsylvania hospitals is information indicating, in simple terms, “how sick the patient was” on admission to the hospital—information that is used to account for higher-risk patients. Even though two patients may be admitted to the hospital with the same illness, there may be differences in the seriousness of their conditions. To account for differences in patient risk, PHC4 uses a complex mathematical formula to risk adjust the mortality and readmission data included in this report, meaning that hospitals receive “extra credit” for treating patients who are more seriously ill or at a greater risk than others. Risk adjusting the data is important because sicker patients may be more likely to die or be readmitted.

PHC4 uses clinical laboratory data, patient characteristics such as age, gender, race/ethnicity, and socioeconomic status, and billing codes that describe the patient’s medical conditions such as the presence of cancer, heart failure, diabetes, etc., to calculate risk for the patients in this report. A comprehensive description of the risk-adjustment techniques used for this report can be found in the Technical Notes on PHC4’s website at phc4.org.

What is measured in this report and why is it important?

In the hospital results section, the following measures are reported for each hospital:

Total Number of Cases

For each hospital, the number of cases for each condition, after exclusions, is reported. This can give a patient or a purchaser an idea of the experience each facility has in treating such patients. Studies have suggested that, in at least some areas, the volume of cases treated by a physician or hospital can be a factor in the success of the treatment. The number of cases represents separate hospital admissions, not individual patients. A patient admitted several times would be included each time in the number of cases. Outcome data are not reported for hospitals that have fewer than five cases evaluated for a measure; such low volume cannot be considered meaningful and, as such, the outcome data are not displayed. Not Reported (NR) appears in the table when this occurs. Note that small or specialty hospitals may report low volume due to the unique patient population they serve or geographic location.

Risk-Adjusted Mortality

This measure is reported as a statistical rating that represents the number of patients who died during the hospital stay. To determine the mortality rating, PHC4 compares the number of patients one could reasonably expect to die in a given hospital for a given condition, after accounting for patient risk, with the actual number of deaths. (Please see “Understanding the Symbols” on page 4.)

About the Report

PHC4 has used risk-adjusted mortality statistics as a measure of quality since it began publishing reports in 1989. The mortality analysis includes Do Not Resuscitate (DNR) cases. Because DNR is defined and utilized differently across Pennsylvania hospitals, such records are retained in the analysis to avoid potential biases in mortality ratings.

Risk-Adjusted 30-Day Readmissions

This measure is reported as a statistical rating that represents the number of patients who are readmitted following their initial hospital stay. A readmission is defined as a subsequent acute care hospitalization to any Pennsylvania general and specialty general acute care hospital, where the admit date is within 30 days of the discharge date of the original hospitalization. To determine the risk-adjusted readmission rating, PHC4 compares the number of patients one could reasonably expect to be readmitted, after accounting for patient risk, with the actual number of readmissions. (Please see “Understanding the Symbols” on page 4.) While some re-hospitalizations can be expected, high quality care may lessen the need for subsequent hospitalizations. For all conditions in this report, planned readmissions were excluded from the analysis. Identifying readmissions that were planned was based on methods developed by the CMS for identifying planned readmissions (please refer to the Technical Notes at phc4.org). In addition, for this report, readmissions with a diagnosis of COVID-19 were not counted.

Case Mix Adjusted Average Hospital Charge

This report also includes the average hospital charge for each of the 17 conditions. The average hospital charge represents the entire length of the hospital stay. It does not include professional fees (e.g., physician fees) or other additional post-discharge costs, such as rehabilitation treatment, long-term care and/or home health care. The average charge is adjusted for the mix of cases that are specific to each hospital. (For more information, please refer to the Technical Notes at phc4.org). While charges are what the hospital reports on the billing form, hospitals typically receive actual payments from private insurers and government payers that are considerably less than the listed charge.

In the payments section of the report is information about Medicare payments:

Medicare Payments

This section of the report displays the average payments made by Medicare fee-for service for the 17 medical conditions included in this report. This information is also broken down by the MS-DRGs within each condition.

About the Report

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual outcome rate to what is expected after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Uses of this report

This report can be used as a tool to examine hospital performance in specific treatment categories. It is not intended to be a sole source of information for making decisions about health care, nor should it be used to generalize about the overall quality of care provided by a hospital. Readers of this report should use it in discussions with their physicians who can answer specific questions and concerns about their care.

- **Patients/Consumers** can use this report as an aid in making decisions about where to seek treatment for the conditions detailed in this report. This report should be used in conjunction with a physician or other health care provider when making health care decisions.
- **Group Benefits Purchasers/Insurers** can use this report as part of a process in determining where employees, subscribers, members, or participants should go for their health care.
- **Health Care Providers** can use this report as an aid in identifying opportunities for quality improvement and cost containment.
- **Policymakers/Public Officials** can use this report to enhance their understanding of health care issues, to ask provocative questions, to raise public awareness of important issues, and to help constituents identify health care options.
- **Everyone** can use this information to raise important questions about why differences exist in the quality and efficiency of care.

About PHC4

Created by the PA General Assembly in 1986, the PA Health Care Cost Containment Council (PHC4) is an independent state agency charged with collecting, analyzing and reporting information that can be used to improve the quality and restrain the cost of health care in the state. Today, PHC4 is a recognized national leader in public health care reporting. PHC4 is governed by a board of directors representing business, labor, consumers, health care providers, insurers, health economists and state government.

Summary and Highlights

The 2022 *Hospital Performance Report* produced by the Pennsylvania Health Care Cost Containment Council (PHC4) provides information about the performance of Pennsylvania hospitals for 17 common medical conditions. Reported are hospital-specific mortality and 30-day readmission ratings, as well as volume of cases and hospital charges for patients discharged from October 1, 2021 through September 30, 2022, which is federal fiscal year 2022. Changes in statewide rates across time are also examined.

In-Hospital Mortality Rates

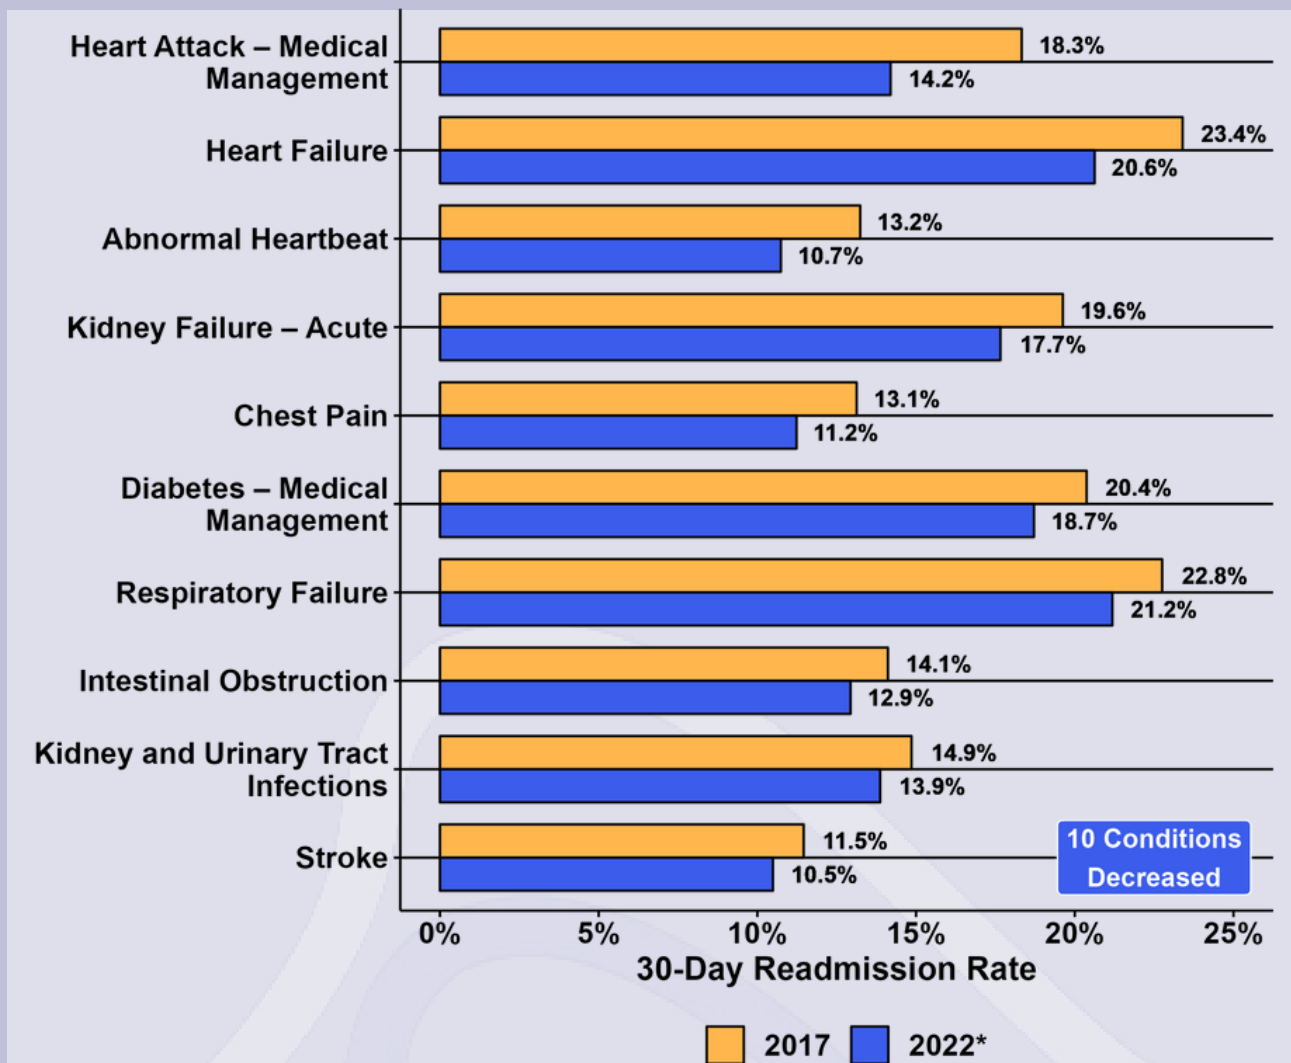

Statewide in-hospital mortality rates showed a statistically significant increase from 2017 to 2022 in 11 of the 16 conditions reported. The largest increase was in Sepsis, where the mortality rate increased from 9.3% in federal fiscal year 2017 to 11.3% in federal fiscal year 2022. No condition showed a statistically significant decrease in the in-hospital mortality rate during this time period. The mortality rate was not reported for one condition, Chest Pain, due to low statewide mortality.

Summary and Highlights

30-Day Readmission Rates

Ten of the 17 conditions reported showed a statistically significant decrease in statewide 30-day readmission rates from 2017 to 2022. The largest decrease was in Heart Attack – Medical Management, where the readmission rate decreased from 18.3% in federal fiscal year 2017 to 14.2% in federal fiscal year 2022. None of the 17 conditions reported showed a statistically significant increase in the statewide 30-day readmission rate during this period.

*Cases with a COVID-19 diagnosis were excluded in 2022. Planned readmissions were excluded from the analysis. Please refer to the Technical Notes at phc4.org for more information.

Abnormal Heartbeat

Table Notes

Abnormal Heartbeat: Includes abnormalities in the heart rate (how fast or slow the heart beats) and/or the heart rhythm (how regular/steady the heart beats). Common examples include tachycardia (too fast), bradycardia (too slow) and atrial fibrillation (too fast and irregular).

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of an abnormal heartbeat. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Back Problem-Medical Management

Table Notes

Back Problem-Medical Condition: Includes conditions such as spinal stenosis (narrowing of the spinal canal), intervertebral disc disorder (problem with cushion-like disc between the bones of the spine), lordosis and kyphosis (deformities of the spine) and vertebral fracture (broken bone of the spine).

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated medically for a principal diagnosis of a back problem. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected.** Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected.** The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected.** More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Blood Clot in Lung

Table Notes

Blood Clot in Lung: Blockage of a blood vessel in the lung caused by a blood clot (also called pulmonary embolism) that travels through the bloodstream, typically from the legs to the lungs, causing damage to, or death of, lung tissue.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of a blood clot in the lung. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Chest Pain

Table Notes

Chest Pain: Pain in the chest that is usually not related to the heart (non-cardiac chest pain). Common causes for this type of chest pain include gastric reflux (“heartburn”), pleurisy (inflammation of the membrane around the lungs) and problems with the ribs and muscles of the chest.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of chest pain. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital’s actual *readmission* rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital’s rate was significantly lower than expected**. Fewer patients were readmitted than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital’s rate was not significantly different than expected**. The number of patients who were readmitted was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital’s rate was significantly higher than expected**. More patients were readmitted than could be attributed to patient risk and random variation.

Chronic Obstructive Pulmonary Disease (COPD)

Table Notes

COPD: A group of chronic respiratory diseases with persistent inflammation and damage leading to reduced airflow in the lungs. Included are common diseases such as emphysema and chronic obstructive bronchitis as well as chronic obstructive asthma.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of COPD. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Diabetes - Medical Management

Table Notes

Diabetes-Medical Management: The body is unable to make enough insulin, or it does not use the insulin properly. Diabetes can lead to acute complications such as a coma from too much or too little glucose (blood sugar) and long-term complications such as kidney disease and damage to blood vessels and nerves.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated medically for a principal diagnosis of diabetes. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Heart Attack - Medical Management

Table Notes

Heart Attack-Medical Management: A heart attack occurs when there is a blockage or obstruction in a blood vessel (coronary artery) causing damage or death to an area of the heart (myocardial infarction). Patients who are treated with a balloon (angioplasty)/stent procedure or open heart surgery are not included.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated medically for a principal diagnosis of a heart attack. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Transfer to Acute Care represents the percent of patients who were transferred to another acute care hospital. This information is provided since there can be wide variation in this rate across hospitals. This rate may be higher in hospitals that do not provide advanced cardiac services (such as percutaneous coronary intervention, PCI) because patients treated at these hospitals may be transferred to another hospital for further diagnosis and treatment.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

See [About the Report](#) section or [Technical Notes](#) for further details.

Heart Attack - Medical Management

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected.** Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected.** The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected.** More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Heart Failure

Table Notes

Heart Failure: Inability of the heart to pump enough blood to meet the needs of the body leading to swelling of the legs and shortness of breath from fluid build-up in the lungs. Common causes of heart failure include heart disease (e.g., coronary artery disease and heart valve problems) and long-standing hypertension (high blood pressure).

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of heart failure. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Intestinal Obstruction

Table Notes

Intestinal Obstruction: Partial or complete blockage of the intestine often caused by a band of scar tissue (adhesions), tumors, or twisting and kinking that prevents food or liquid from passing beyond the blockage.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of intestinal obstruction. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Kidney and Urinary Tract Infection

Table Notes

Kidney and Urinary Tract Infection: Infections of the urinary tract, which includes the kidneys (pyelonephritis) and bladder (cystitis). These infections can be acute or chronic.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of kidney or urinary tract infection. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Kidney Failure - Acute

Table Notes

Kidney Failure-Acute: A sudden and rapid loss of kidney function resulting in a build-up of waste products that are normally filtered by the kidneys and removed from the body through urine. Because these waste products are toxic, acute kidney failure can be life-threatening. Acute kidney failure may be caused by trauma, surgery, dehydration, medication or other conditions.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of acute kidney failure. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Pneumonia - Aspiration

Table Notes

Pneumonia-Aspiration: Caused by inhaling food, liquid, mucus or vomit into the lungs leading to inflammation and/or infection. Common causes include coma, problems with swallowing and decreased mental alertness from medication or alcohol.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of aspiration pneumonia. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Pneumonia - Infectious

Table Notes

Pneumonia-Infectious: An infection in one or both lungs caused by bacteria or viruses.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of infectious pneumonia. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Respiratory Failure

Table Notes

Respiratory Failure: Failure of the lungs to support the exchange of oxygen and carbon dioxide causing impairment of critical body functions. Treatment depends on the severity of the condition. Included are both acute (short-term illness that is treated as a medical emergency) and chronic (develops over time and may require long-term treatment) forms. In some cases, a mechanical ventilator (“breathing machine”) may be necessary to assist with breathing.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of respiratory failure. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital’s actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital’s rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital’s rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital’s rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Sepsis

Table Notes

Sepsis: A system-wide inflammatory response to infection that can worsen and include life-threatening acute organ dysfunction.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of sepsis. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected.** Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected.** The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected.** More patients died (or were readmitted) than could be attributed to patient risk and random variation.

Stomach and Intestinal Bleeding

Table Notes

Stomach and Intestinal Bleeding: Bleeding in the stomach or intestinal tract (small intestine, large intestine or rectum) commonly caused by an ulcer or area of inflammation.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of stomach or intestinal bleeding. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected.** Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected.** The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected.** More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Stroke

Table Notes

Stroke: An ischemic stroke, which occurs when there is an obstruction (blockage) in a blood vessel in the brain or neck causing damage or death to an area of the brain. Not included are patients who are treated with a balloon (angioplasty)/stent procedure or other surgery to remove the obstruction responsible for the stroke, or patients admitted with a rupture (break) in a blood vessel in the brain (hemorrhagic stroke) unless the hemorrhage occurs after the ischemic stroke but during the hospitalization.

Total Number of Cases includes all inpatient hospitalizations, after exclusions, for patients 18 years and older who were treated for a principal diagnosis of a stroke. Patients with a diagnosis of COVID-19 were excluded, as well as those who were transferred to another acute care hospital or left against medical advice.

Mortality represents patients who died during the hospital stay.

Readmission represents patients who were readmitted to a Pennsylvania general or specialty general acute care hospital within 30 days of the discharge date of the original hospitalization. Out-of-state residents were excluded because readmission data was not available for patients readmitted to a non-Pennsylvania hospital. Planned readmissions were not counted.

Average Hospital Charge represents the entire length of stay and is trimmed and case-mix adjusted. Professional fees were not included. In almost all cases, hospitals typically receive actual payments from private insurers or government payers that are considerably less than the listed charge.

Understanding the Symbols

The symbols displayed in this report represent a comparison of a hospital's actual mortality (or readmission) rate to what is expected, after accounting for patient risk.

The ○ symbol indicates the **hospital's rate was significantly lower than expected**. Fewer patients died (or were readmitted) than could be attributed to patient risk and random variation.

The ⊙ symbol indicates the **hospital's rate was not significantly different than expected**. The number of patients who died (or were readmitted) was within the range anticipated based on patient risk and random variation.

The ● symbol indicates the **hospital's rate was significantly higher than expected**. More patients died (or were readmitted) than could be attributed to patient risk and random variation.

See [About the Report](#) section or [Technical Notes](#) for further details.

Medicare Payments

The following table includes information about payments made by Medicare for the 17 medical conditions included in this *Hospital Performance Report*. The payments analysis is based on data from federal fiscal year (FFY) 2022. This information, provided by the Centers for Medicare and Medicaid Services (CMS), reflects the average amounts paid by Medicare fee-for-service for inpatient hospitalizations of Pennsylvania residents only. Payments from Medicare Advantage plans (e.g., Medicare HMOs) are not included, nor are patient liabilities (e.g., coinsurance and deductible dollar amounts).

The average Medicare fee-for-service payment is calculated using the claim payment amount based on data provided by CMS. The average payment is calculated by summing the payment amounts for the cases in a particular medical condition and dividing the sum by the number of cases in that condition.

Most of the medical conditions included in this report are defined using ICD-10-CM (International Classification of Diseases, Tenth Revision, Clinical Modification) diagnosis codes, with a secondary requirement that they be limited to particular MS-DRGs (Medicare Severity – Diagnosis-Related Groups) – information available from the discharge data that PHC4 receives from Pennsylvania hospitals. Technical Notes relevant to this report provide additional detail and are available at phc4.org.

In this section, average payments are displayed for the 17 medical conditions included in this report – broken down by the MS-DRGs included within each condition. While the 17 conditions have been defined using diagnosis codes that represent a clinically cohesive population, the payment data is displayed by the individual MS-DRGs included within each condition to account for variations in case mix.
